Team Blinky Lights - Blinky Lights

☺ Reid “The Smoking GNU” Anetsberger (Product Owner)

☺ David “PyThug” Futscher

☺ Kevin “3.5 Inch Floppy” Yeap

☺ Connie “Dirty Bit“ Yu

☺ Steven “Cyber Wizard” Morad

12/4/2014

Application Domain

- Our project is a spherical persistence of vision (POV) LED display that can be programmed wirelessly with a Bluetooth equipped computer and our client app.
- The client app allows easy presentation of text and images on the display.

Client Software

Main idea: Canvas

- 3D sphere shows pixels - can rotate
- Selectable colors
- Text field to easily display text
- Upload button to display the canvas on the actual device

Challenges and Accomplishments

Challenges

- Physics / balance
- Wireless communication
- New to working with HW (some team members)

Accomplishments

☺ Good planning allowed HW & SW software code to be developed independently and integrated seamlessly.

Technologies and Techniques

Technologies

- Java 1.8
- Gradle Build Automation
- OpenGL
- Bluetooth (java serial library)
- Arduino

Project Management Techniques

- Scrum

SCRUM

Iterative approach was ideal for our group

Sprints structured as follows:

- Plan out the HW & SW implementations of user stories at the first and divide into tasks (Sprint Plan)
- Team members complete HW & SW tasks of a user story independently
- Meet up to combine components of HW & SW together, then move on to next feature’s tasks.

Lessons Learned

- ☹ Hardware prototypes prone to breaking
- ☹ Metal spinning at 1800 RPM is dangerous!
- ☹ Bluetooth is SLOW
- ☹ Difficult to accurately predict how long programming tasks will take
